Mehr Sicherheit beim Autofahren durch VR-Brillen

Ab Sommer setzt der ÖAMTC VR-Brillen ein, um Autofahrer in punkto Fahrsicherheit zu schulen.

Austria's 'L' drivers in virtual accidents

Virtual reality headsets show learner drivers the consequences of their actions

Austrian learner drivers will don virtual reality headsets as part of a plan to use artificial accidents to help them cope with real challenges on the road.

In one simulated scenario, the driver glances down at a mobile phone before the car overruns off the road and the windscreen shatters.

"After the crash I was shocked," said Antonella Serbia, 19, who tried the equipment last week. "You can see what can happen if you don't pay attention."

The project has been developed by the Austrian Automobile Club with Samsung and will be launched in March.

"Our philosophy is: if you tell people they won't believe it, if you show them they will," said Franz Schönbauer, head of the club's road safety training centres. "It's not unusual to scare students, just to show them the consequences of their actions."

It will become a key feature of the "technical" courses that learner drivers in Austria must complete within a year of passing their practical test, with new videos introduced every few months.

Schönbauer's team is working to develop full-scale simulators that will allow students to meet, accelerate, brake and "influence the situation".
